

February 25, 1980

Memo to File:

RE: Martin-Marrietta
Leamington Cement Plant
ACT/023/004

The above mentioned operation was inspected by Tom Suchoski of the Division staff on February 19, 1980. He was accompanied by Mr. Marv Berg of Martin-Marrietta.

The site of the quarries and plant are approximately 5 miles north of Leamington on Highway 132.

The area is a previously mined site. The major access roads are already existing and in good condition. Several additional roads have been cut by Martin-Marrietta to facilitate the drilling program for the site. These roads will be reclaimed.

Two quarries are proposed, one limestone, the other quartzite. The largest of which will be the limestone quarry.

Vegetation in the area consists of mainly sagebrush and pinyon-juniper, with a smattering of rabbitbrush and a few grasses.

Mr. Berg was requested to address the reclamation of the plant site in more detail.
